Vol. 9, No. 12 - Vol. 10, No. 1.

June-July 1951.

## NEW BOOKS IN THE LIBRARY

THE ABC OF SOILS, by J. S. Joffe. Pedology Publications, 1949. 283p.  
56 J59

Presumably this is the first textbook on soils and their management which treats the subject from the pedologic point of view. The author tells us that pedology is the science dealing with the natural laws governing the origin, formation, and geographic distribution of the soil as a distinct body in nature. The book is divided into two parts--a discussion of soil as a natural body and a discussion of soil as a medium of plant growth.

THE BACKGROUND OF PLANT ECOLOGY, by H. S. Conard. Iowa State College Press, 1951. 238p. 459 K45Ae

This is a translation from German of one of the classics of modern plant sociological literature: The Plant Life of the Danube Basin by Anton Kerner. The original book, published in 1863, is the immediate and direct parent of all later works on plant ecology. The book is mentioned in all extensive bibliographies but is rarely found in libraries. Consequently, Dr. Conard felt that it should be translated and made more widely available. It should be of special interest to foresters and ecologists, though any one who loves trees will find it entertaining.

BASIC HORTICULTURE, by Victor R. Gardner. Macmillan, 1951. 465p. 90.4  
G17 Ed.2

This book was written with the idea of helping the student acquire a real understanding of plants--their structure, how they grow, and the way in which they react to different environments. The author feels that with an understanding of basic horticultural principles, a person can solve for himself many problems that arise. Such principles are presented in chapters on plant classification, structure, and growth; temperature relations of plants; the limiting factors of water, light, and plant nutrients; growth and fruitfulness; flower-bud differentiation and flowering habits; training horticultural plants; pruning; propagation; hormones and growth regulators; the culture of annuals, biennials, and perennials; plant pests and diseases.

FIFTY YEARS OF FORESTRY IN THE U. S. A., edited by R. K. Winters. Society of American Foresters, 1950. 385p. 99.04 Sol

As its title indicates, this is a history of the growth of the profession of forestry in the United States. Each of the nineteen chapters is written by

a specialist in that subject. The first chapter summarizes briefly the principal professional developments to date. Chapters two through eight give in more detail the development of several of the important phases of forestry. Chapters nine through nineteen trace the growth of the several important agencies and activities that have advanced professional forestry.

FOREVER THE LAND: A COUNTRY CHRONICLE AND ANTHOLOGY, edited and illustrated by Russell and Kate Lord. Harper, 1950. 394p. 30.4 L88

Those who have been interested in the Friends of the Land organization and its magazine The Land will feel that they are meeting old friends when they read this book, for it is largely a collection of articles and poetry published in The Land. To those who do not know the magazine, and who love nature and the good earth, this book will be a fascinating discovery.

AN INTRODUCTION TO PLANT PHYSIOLOGY, by O. F. Curtis and D. G. Clark. McGraw-Hill, 1950. 752p. 463.3 C94

This is a text prepared for students taking a first course in plant physiology. The emphasis is more on ecology and water relations than on the biochemical aspects of plant physiology.

PLANT PATHOLOGY, by J. C. Walker. McGraw-Hill, 1950. 699p. 464 W15

"The purpose of this text is to provide the basic facts whereby the student may be introduced to the scientific foundations of plant pathology. It is not a manual of disease descriptions nor a handy compendium of remedial measures. It presents rather comprehensive treatments of better known representative diseases which may serve as guides to the general principles underlying the science of plant pathology. Since the background of any science is basic to a full understanding of its present trends, a chapter on the history of plant pathology is included. Following the chapters on specific disease groups, consideration is given to environmental factors, host-parasite relations, and the methods of disease control." Preface.

SHRUBS AND VINES FOR AMERICAN GARDENS, by Donald Wyman. Macmillan, 1949. 442p. 97.3 W98

This book was written to aid both the amateur and the professional gardener in selecting the best plant for the right place. Approximately 1100 species and varieties of shrubs and vines are suggested as worthy of planting under certain conditions, and over 1700 as of secondary interest only. While the reader may not agree with the arbitrary groupings of the author, he can analyze his personal likes and dislikes with a study of the author's suggestions and find the book helpful.

THE STORY OF PLANTS, by John Asch. Putnam's, 1948. 407p. 463 As2

"This is a unique and fascinating story for those interested in the life of plants. It is simply written, with a fresh approach which will be a relief from the dry and lifeless technique often employed in scientific writing. The author, son of the world-renowned Sholem Asch, has a background of wide experience which enables him to give a clear analysis of the atom, the elements of life in plants, soil and all nature. It is an accurate and thorough work." From American Forests, August 1949.

TREE CROPS: A PERMANENT AGRICULTURE, by J. Russell Smith. Devin-Adair, 1950. 408p. 99 Sm6

This is essentially the same book first issued in 1929. The new book is more attractive in format and more readable as the many footnotes of the first

edition have been incorporated into the text. A substantial amount of new material has been added. Some of the trees considered are the carob, honey locust, mesquites, mulberry, persimmon, chestnut, oak, the walnuts, and the hickories. Bernard Baruch said, "Anyone with a plot large enough to plant a tree will be interested in reading this book."

WATER-OR YOUR LIFE, by Arthur W. Carhart. Lippincott, 1951. 312p. 292 C192

"The recurring droughts and water shortages which plague this nation offer tangible evidence of mismanagement and abuse of water resources. Here is a timely and important account of the manner in which usable water supplies are being gradually depleted and destroyed through carelessness and faulty conservation measures. It provides a vivid picture of the importance of water in our everyday life and of the almost insatiable and conflicting demands on existing water supplies. The author is highly critical of many government sponsored projects which he contends have been unjustified and ill-advised, and which through the destruction of animal life and recreational areas have done more harm than good. A practical program of water management and control is briefly outlined." Library Journal, April 1, 1951.

### SELECTED BULLETINS

#### Agronomy

"Bermudagrass Research in Texas." Tex. Agr. Expt. Sta. Cir. 129. 1951. 25p.  
100 T31S 129
